

# Systems administrator

Position: Full time

Location: Cambridge (UK)

Salary: Dependent on experience

Benefits: Company Pension, Flexible working, Positive people, Can-do workplace, Training, Growth opportunities, Proximity to transport hubs and city.

**Bubble are looking for an experienced systems administrator who can demonstrate their experience of working with high performance and scalable enterprise web applications in an agile environment.**

This is a great opportunity for the right person and you'll be joining the business at an exciting time, as we deliver the next generation of our world-class enterprise software.

If you're keen to join a growing company with a culture that's dynamic, forward-looking, and technologically advanced, then please get in touch. The core application development team is located in our central Cambridge office, which is within walking distance of key transport hubs and the city's many shops, bars and restaurants.

## Technical experience

We are looking for a capable, independent individual who can effectively manage long and short term goals, who will integrate well with our dedicated team of developers, and who naturally works to high quality standards. Training can be provided, but our ideal candidate will have these:

### Primary skills

- Linux server administration
- Experience with Amazon Web Services
- Experience with SaaS applications
- Web server management
- Knowledge of networking and security

### Desirable skills

- Windows server administration
- Docker
- Kubernetes
- Continuous integration/continuous deployment
- Bash and/or PowerShell scripting
- Database Server administration (Postgres, MSSQL)

## Summary duties/responsibilities

The systems administrator will be responsible for managing the existing application and infrastructure, planning and implementing improvements, as well as developing new solutions to support our future software development.

- Monitor and support the application environment
- Setting up new environments for testing, development and production
- Work closely with development team to understand requirements for new projects
- Independently advance projects such as migrations, upgrades and installation
- Responsible for ensuring compliance with ISO27001
- Capacity planning and monitoring storage and resources
- Take ownership of web application security by maintaining scans, arranging penetration tests and running the vulnerability management process
- Improve the consistency of our systems performance using effective configuration management tools
- Create processes to easily deploy new environments through documentation and programming
- Assist with customer acquisition and support by providing technical input
- Liaising with customer technical staff where required
